Data Connectivity

Crystal Reports can connect to almost any data source—including relational, OLAP, and XML data. Whether you require access to databases, files, logs, application systems (Customer Relationship Management, Enterprise Resource Planning, etc.) or program elements, you can use Crystal Reports to access it. Crystal Reports also supports Unicode so you can report off of data stored in virtually any language. Plus, for developers, access to user-defined or application in-memory data is available through JavaBeans, COM data providers and ADO .NET.

For a listing of supported data sources for a specific version, please visit our support site to download a platforms.txt file.

Examples of supported data sources through native drivers, OLE DB, ODBC, and JDBC include:

Oracle®, IBM® DB2®, Sybase, Microsoft® SQL Server, Microsoft SQL Server Analysis Services, Informix®, Act!, Pervasive, Pervasive SQL, Microsoft Access, Teradata, Holos, SAP BW, BDE, CDO, Microsoft Internet Information Server, Microsoft System Management Server, Microsoft Windows NT Event Logs, Microsoft Outlook, Paradox, XML/XSD, Lotus Domino, Microsoft FoxPro, Web Server Activity Logs (NCSA format), ASCII, Dbase, and Informix.

Notes:

- Crystal Reports for Java includes a custom standalone Windows designer.
- Managed repository is now provided through Crystal Reports Server.
An introductory offer is included in Crystal Reports Professional and Developer editions.
- The functionality of this feature is enhanced when used in conjunction with Crystal Reports Server.
A special introductory offer of Crystal Reports Server is included in Crystal Reports Professional and Developer editions.
- Dynamic and Cascading Prompts can be viewed, but cannot be designed in the Standard Edition
- Read only for Standard Edition.
- Stored Procedure Support in Standard Edition is via ODBC for Access, Excel and SQL only.
- Some components may be provided in English only.
