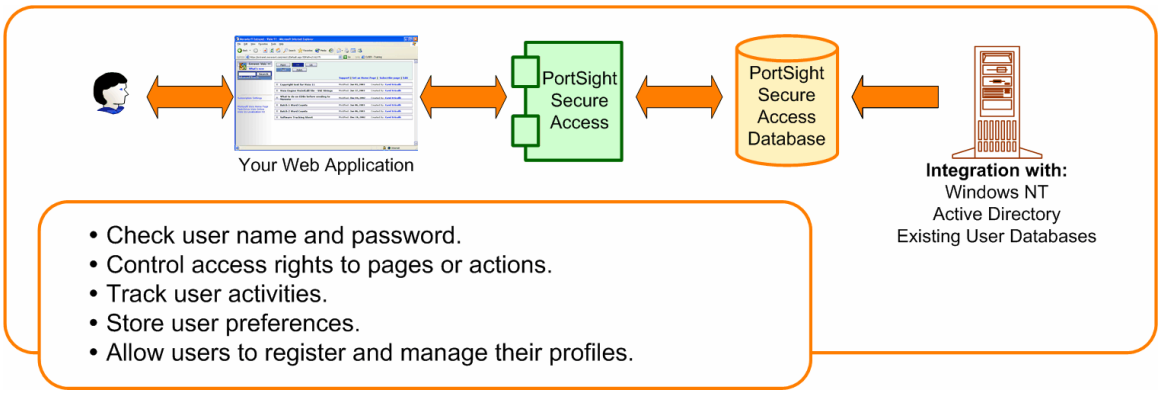
PortSight SECURE ACCESS

How **Secure** is your **Web Site?**

Overview

PortSight Secure Access is a component for Microsoft .NET that allows you to secure and personalize your ASP.NET applications and Web sites. You can easily check user names and passwords, control access rights and track user activities. It can be integrated with legal user databases and with Active Directory. Simply – it's the most comprehensive identity management solution for your next project!



Benefits

Enable Self-Service and Save on Support

Your users can register at your Web Site and update their profile themselves. They can change their passwords and receive forgotten password in e-mail. Privileged users can manage specified groups and permissions.

Reduce Your Development Time

Using reusable classes and Web controls, you can use the PortSight Secure Access system for any number of Web Sites without developing the security system again and again. You can re-use the libraries as well as user controls.

Keep the Identities Manageable

With PortSight Secure Access, you get an easy-to-manage and easy-to-deploy identity management system.

Reuse Existing User Profiles

You can easily import your existing user catalogs, including those from Active Directory, Windows NTLM and your databases into PortSight Secure Access database (Enterprise Edition only).

Start Immediately with Short Learning Curve

You can learn all you need to start using PortSight Secure Access one-page Quick Reference sheet. The most frequent commands can be implemented in one line of code.

Security and User Management for Your Web Applications

PortSight SECURE ACCESS

Features

User Management You Already Know

Your administrators will become familiar with the Web-based management system very quickly since it's similar to Microsoft Windows management.

More Flexible with Organizational Units and Nested Groups

You can organize users into groups and hierarchical organizational units. The user groups can be nested which makes the access rights system more flexible to the requirements of your organization.

Authentication Model of Your Choice

PortSight Secure Access supports both Windows NT and forms authentication.

Unlimited Number of Users and Applications

The number of users and applications in the PortSight Secure Access database is restricted only by your system capacities. Purchasing user licenses is not required.

Better Insight with Permission Matrix

Each application can consist of several application parts. This allows you to grant users permission to use a particular feature. The administrator or delegated user can use the permission matrix for setting the access rights. Each application can also have its own set of user roles.

Easier Management with Delegation

You can delegate privileged users to manage access rights, control members of particular group or create user accounts themselves. They will no longer wait for your administrator.

User Preferences without Cookies

Users can have any number of properties (such as preferred language, colors or favorite topics) saved in their profile on the server. You don't have to use insecure and problematic client-side cookies.

System Requirements

PortSight Secure Access component is based on the Microsoft .NET Framework, which makes it an easy-to-deploy and cost-effective solution. It requires ASP.NET for its Web-based user interface. It is currently available for Microsoft SQL Server 2000. You can use it for development of Visual Basic.NET and C# applications.
